

I would hope that the Commisioners would not get swept away in approving nationwide deployment of BPL. While nationwide broadband deployment of the Internet is an admirable goal; there are proven, less expensive, and less interference porbable methods of delivery already available.

Other countries such as Japan, Austria and others have decided that the interference causing properties of BP: outweigh the potential benefits and have banned it in those countries.

As a licensed Amateur Radio operator engaged in CERT efforts as well as other public safety related radio communications, I urge the Commission to be very cautious about the proven interference problems that BPL creates. We all know our radio spectrum is a finate and valued resource; please do not allow it to be obliterated by harmful, untested and unrpoven technology.

Respectfully,

Lawrence J Makoski
